

CT Through Tubing Retrievable Packer Staged Acidizing Technology

The technology is passed through the tubing expansion packer through the coiled tubing operation. After passing through the production tubing, it is sealed in the casing/liner to separate the upper and lower layers, which can realize the stage acidizing through tubing. Anton offers reliable coiled tubing operations and a stable performance of the tubing expansion packer to meet the requirements of different wellbore conditions..

Technical features:

- High efficiency through coiled tubing
- no need to pull out the tubing. Through tubing operation
- The packer is retrievable with no impact on production.
- Double packer sets are available upon request

Application range:

- Suitable for all wellbore sizes
- Limited wellbore size
- Staged acidizing

Achievement

At present, 5 wells had been done in Iraq, which solved the problem that is hard to resolve by using traditional measures.
